

ABSTRACT OF THE DISCLOSURE

The present invention provides a system and a method for software conversions which maps and translates data from model reports to files formatted as either Comma
5 Separated Value (CSV) files or Flat Fixed Position files in order to migrate the data from one software systems' service to a similar service of a different software system. Using a report generated from the current system and a translation tool the data is mapped and translated to the receiving systems' conversion format. By developing standard reports and pre-defined translation templates data from one system's application can be
10 converted easily, repeatedly and efficiently.
